

Final Reflection

- 1. After labeling and training 10 boarding passes, got around confidence score of 93%. But, on testing one of the passenger boarding pass out of 5, Boarding Time value was getting assigned as Gate Number. Even after adding different training data, still getting the same value for Boarding Time.**

Issue was fixed by increasing the font-size of Boarding Time on the boarding pass for that passenger.

- 2. Even after generating SAS token for containers in Azure Blob Storage, unable to access boarding passes to label and train as getting connection error.**

Issue was fixed by extending the expiry date and time on Azure portal for SAS token, recreating the connection and creating a new project.
